DISTINGUISHING CHARACTERISTICS OF DELIRIUM, DEMENTIA AND DEPRESSION

DELIRIUM DEPRESSION DEMENTIA			
DEFINITION	Delirium is characterised by an acute fluctuating onset of confusion, disturbance in attention, disorganised thinking and/or decline in level of consciousness	A change of mood that lasts at least two weeks with feelings of sadness and loss of interest and pleasure in usual activities	Dementia is a gradual and progressive decline in mental processing ability, affecting memory, communication, language, judgement and abstract thinking
ONSET	Sudden onset over hours or days	 Variable: Weeks to months. May coincide with life changes	Gradual onset over months to years
COURSE	 Reversible with early treatment but can cause serious disability or death Often fluctuates over 24 hour period Worse at night and on awakening 	 Usually reversible with treatment Often worse in the morning 	 Progressive. May be slowed with treatment but not reversed
MEMORY	Impaired - recent and immediate memory	 Generally intact or may be minimally impaired Can be selective In severe cases can present as a pseudo-dementia 	Impaired - recent and remote memory
THINKING	 Fluctuates between rational and disorganised/ distorted thinking Fluctuating alertness and cognition 	 May be indecisive Reduced concentration Low self esteem Feelings of hopelessness 	 Difficulty with abstract thinking Poor decision making May have word finding difficulty
PERCEPTION	 Distorted: Illusions, delusions and / or hallucinations Difficulty distinguishing between reality and misperceptions 	 Themes of guilt and self loathing May experience delusions and/or hallucinations in severe depression 	 Signs may include delusions of theft/ persecution Hallucinations depending on type of dementia e.g. Lewy Body Dementia
SLEEP	Disturbed but no set pattern- may have noctural confusion, day/night reversal	Disturbed Early morning wakening or hypersomnia	Normal to fragmentedMay have nocturnal wandering and confusion
MOOD	Variable – irritable, aggressive, fearful	 Depressed Flat, sad, withdrawn Changes in appetite Diminished interest in usual activities 	 Variable – irritable, apathetic, labile Depressed mood often present in early dementia
DIAGNOSIS	 Diagnosis based on rapid onset of fluctuating symptoms Can be mistaken for progression of dementia 	 May deny being depressed but exhibit anxiety Others may notice symptoms first Increased complaints of physical illness Social withdrawal is common 	 Usually diagnosed approximately 2-3 years after onset of symptoms Must rule out other cause of cognitive decline e.g. depression or delirium
